Adaptive Units

The problem

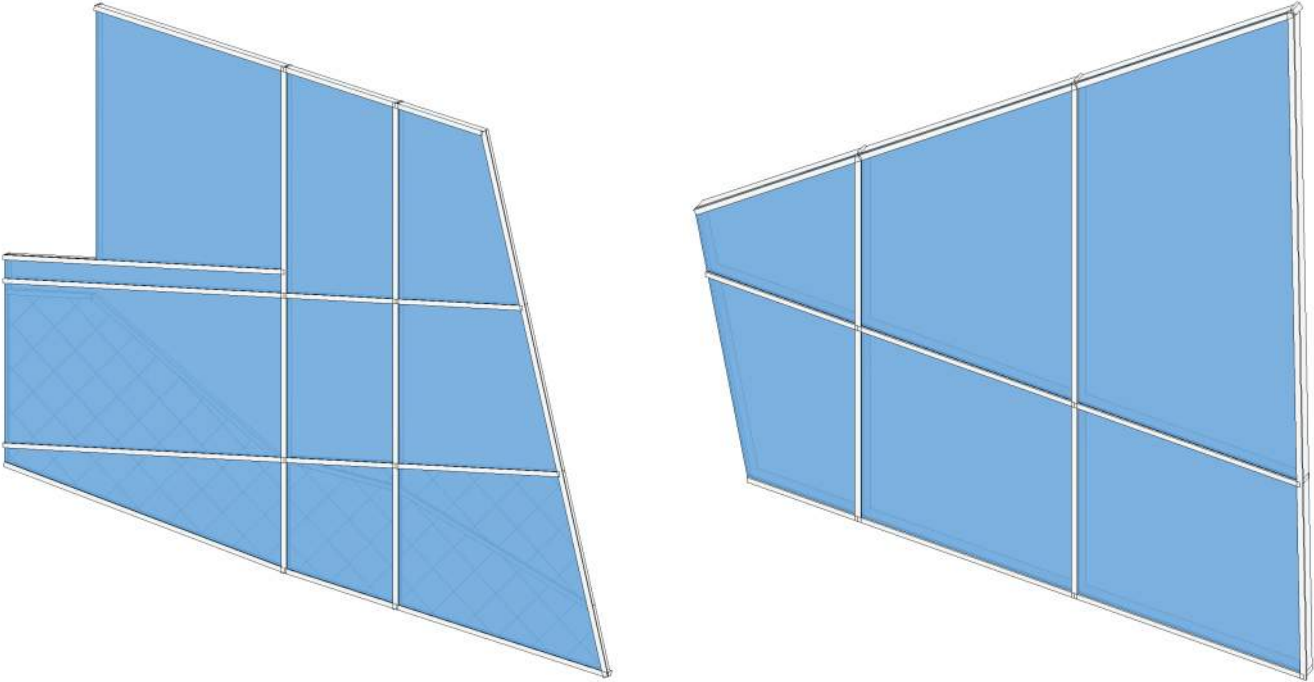

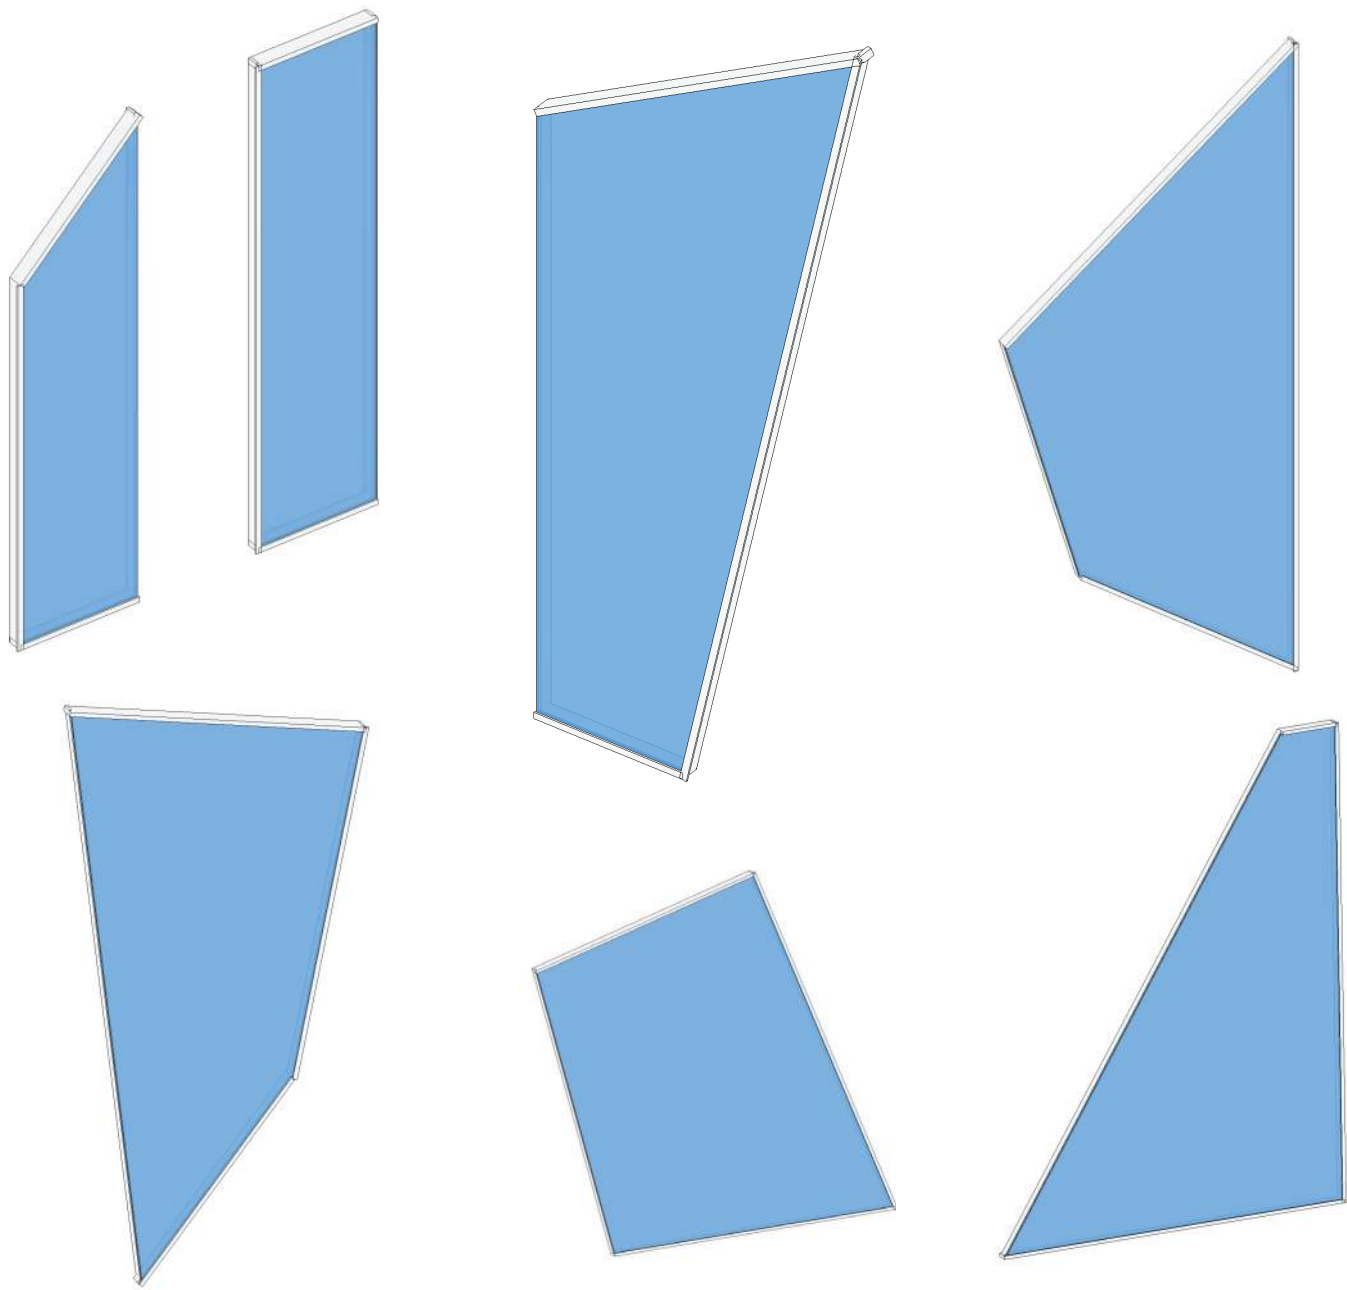

At my previous job, the company used curtain panels for their modeling process. These curtain panels were designed to resemble our unitized window systems, complete with a head, sill, verticals, infills, etc. These units were made within my department and carried downstream to where the takeoff team would produce fabrication drawings.

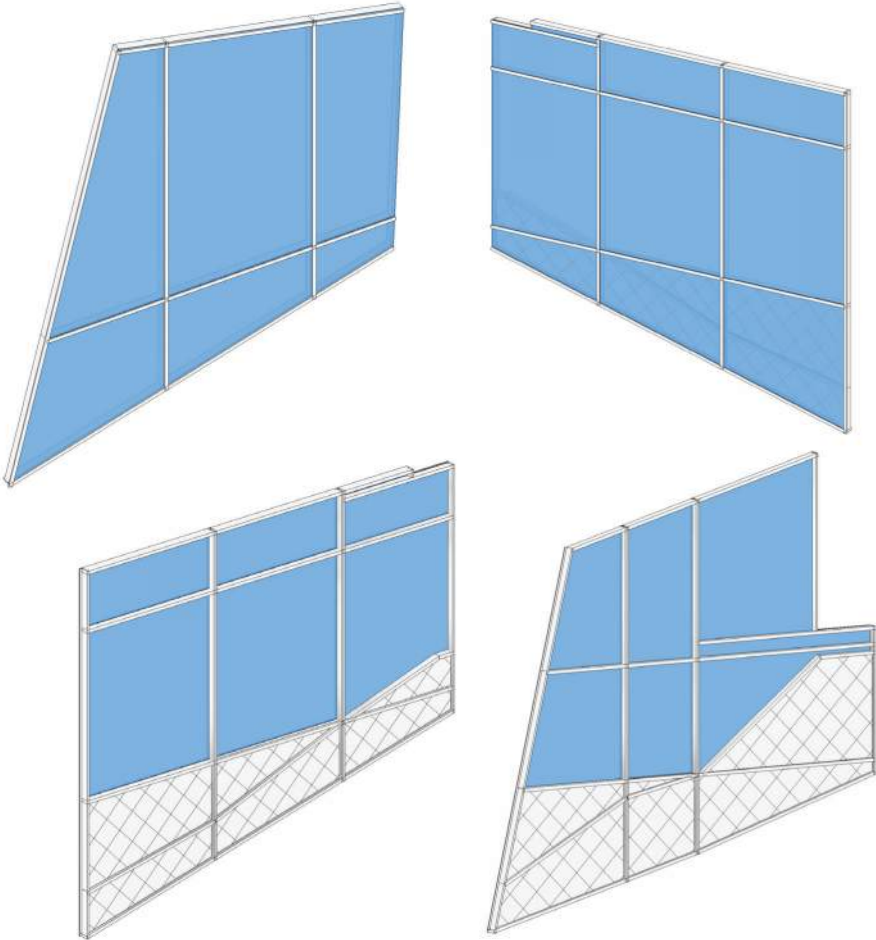

This modeling method was highly successful, except for one major drawback. If the wall happened to be raked or angled, our curtain panel families would not work. Revit does not allow you to fill a varying nonrectangular curtain panels with standard curtain panel families.

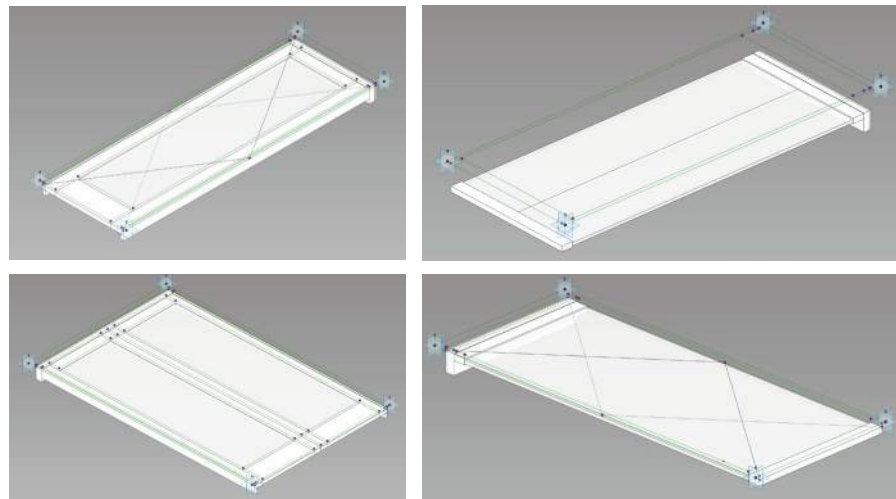

The answer to our problems was found in adaptive generic models. Adaptive families are able to use points that allow them to stretch and flex based off their hosting points.

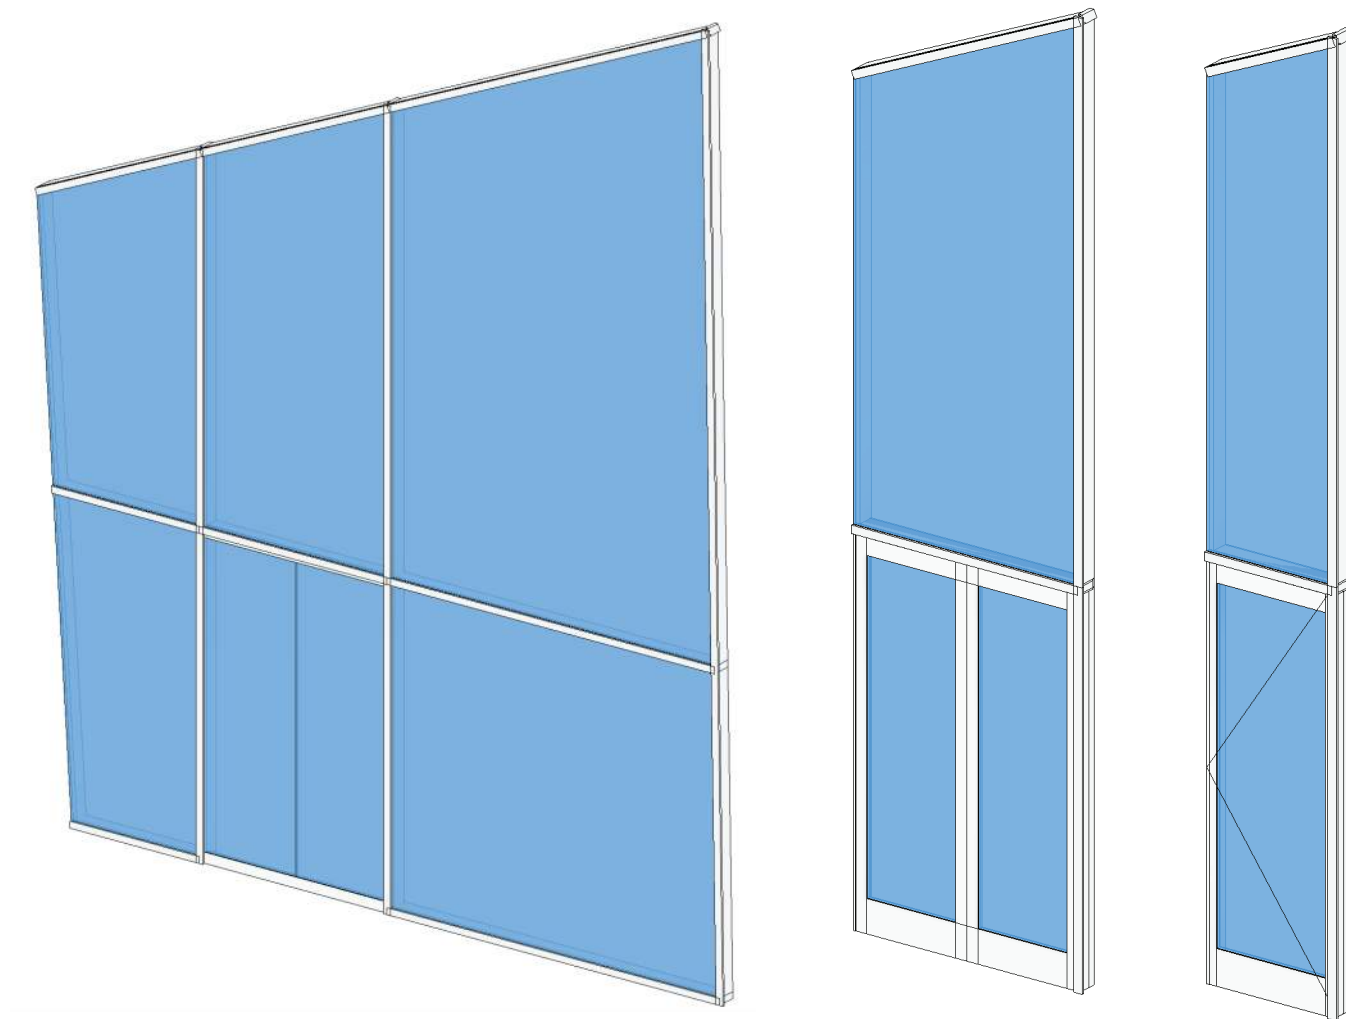

Adaptive units allow for a large variety of different shaped units with various amounts of lites and configurations. These units contain all the same functionality as a regular, squared unit. They have backpans and shadowboxes, the mullions can be swapped for different profiles, different infills can be assigned, etc. Here are just a few examples of the shapes and types of adaptives I created.

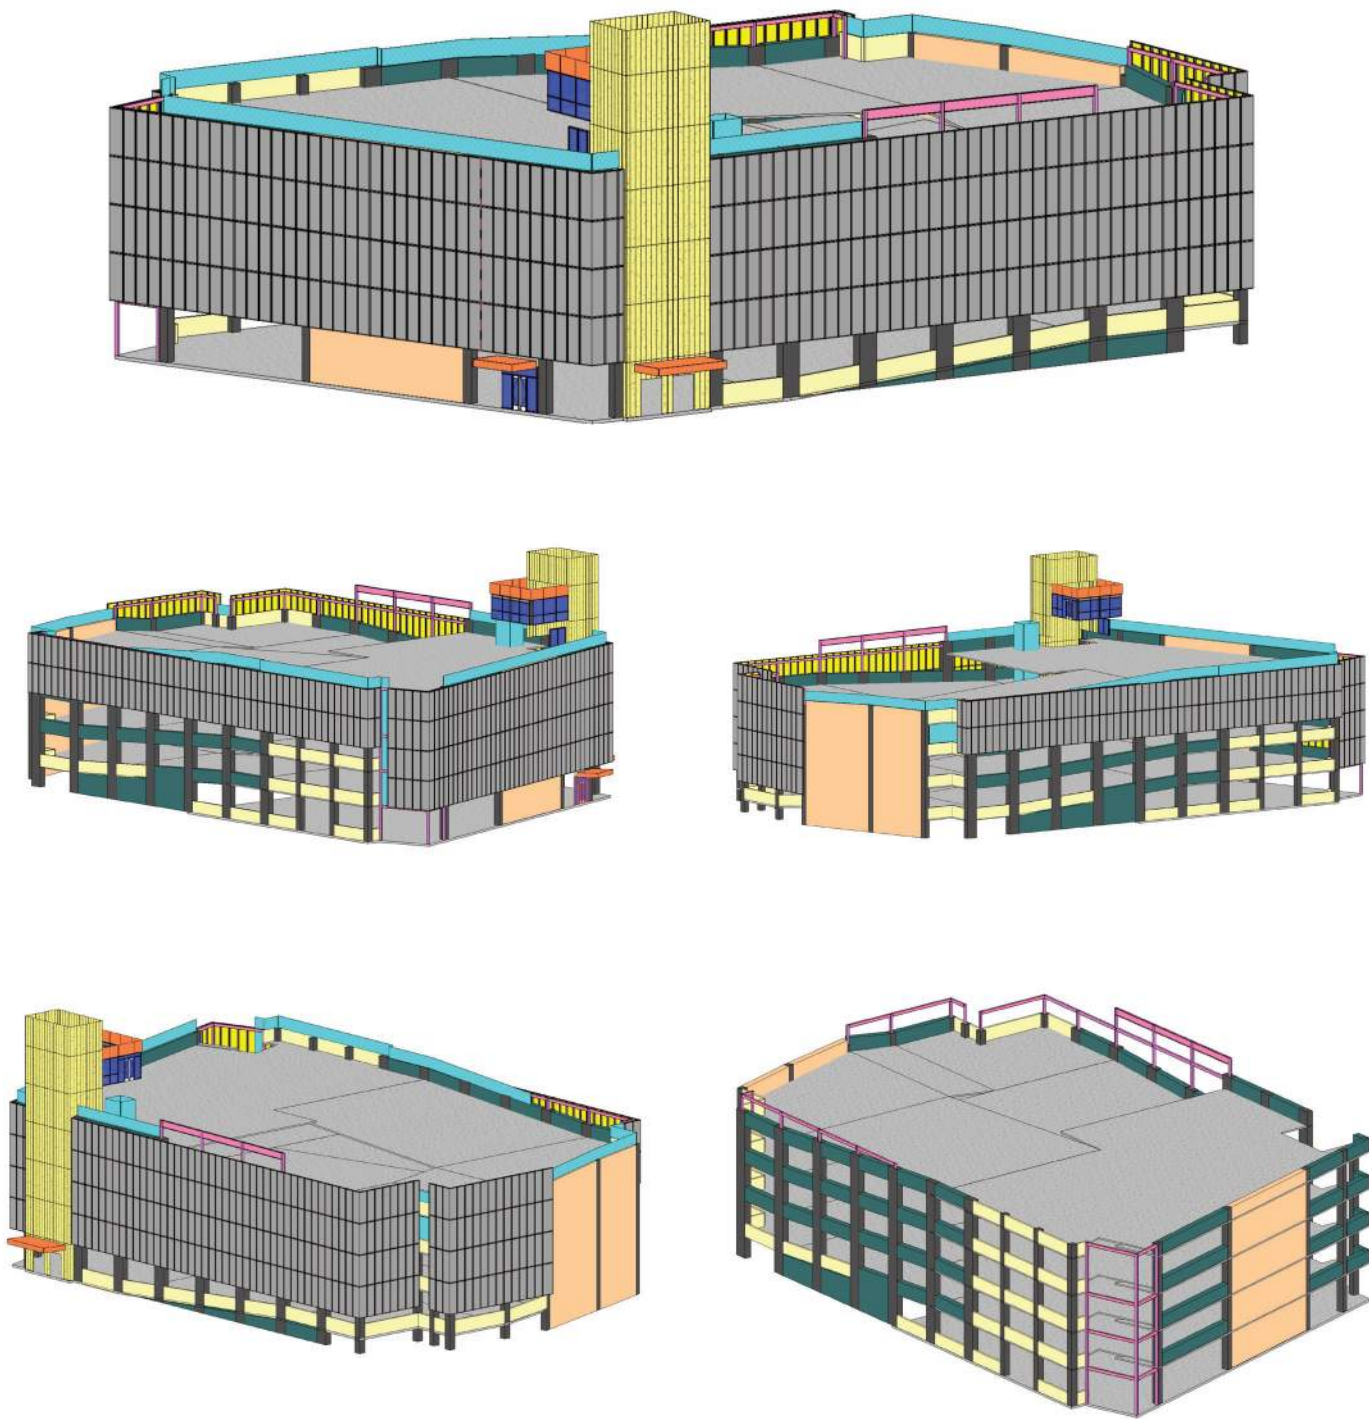

In order for a door to be placed into these units, I had to recreate my door families as adaptive generic models that would flex with the unit and adjust based off job specific conditions. Once I created these door infills, I could easily swap the glass infills out with the door infills.
